

Package ‘scopr’

August 17, 2017

Title Read Ethoscope Data

Date 2017-08-08

Version 0.0.0.9000

Description

Retreive behavioural data from the Ethoscope platform (<http://gilestrolab.github.io/ethoscope/>).

Depends R (>= 2.10)

Imports behavr,
data.table,
hms,
readr,
stringr,
RSQLite

Suggests testthat

License GPL-3

Encoding UTF-8

LazyData true

region_id_query	6
scopr_example	7

Index	8
--------------	----------

list_result_files	<i>List all available result files</i>
-------------------	--

Description

This function discovers all ethoscope result files and put them in a `data.table::data.table`. This is useful to figure out when and which experiments were performed.

Usage

```
list_result_files(result_dir, index_file = NULL)
```

Arguments

result_dir	the root directory where all data are saved
index_file	the name of an index_file, in result_dir (useful for loading remote data).

Value

a `data.table::data.table`. each row is a single experimental file, and columns describe details such as: its path, start date and time, and the name and id of the ethoscope used.

See Also

- [query_ethoscopes](#) – to load the actual data
- [parse_query](#) – to generate a query
- [read_metadata](#) – to show the metadata of a specific experiment

Examples

```
todo
```

no_region_id_query	<i>A simple toy query defining three experiments to query, with one condition (test) per experiment. Implicitly, 20 animals are in each experiment It serves as a simple example.</i>
--------------------	---

Description

A simple toy query defining three experiments to query, with one condition (test) per experiment. Implicitly, 20 animals are in each experiment It serves as a simple example.

Usage

```
no_region_id_query
```

Format

An object of class `data.frame` with 3 rows and 4 columns.

Author(s)

Quentin Geissmann

parse_query	<i>Build a query for loading ethoscope data</i>
-------------	---

Description

This function makes a query table, which is essential for subsequent loading of ethoscope data (via [query_ethoscopes](#)).

Usage

```
parse_query(x, result_dir = NULL, index_file = NULL)
```

Arguments

- | | |
|------------|--|
| x | object such as a data.frame , or the name of a file (see detail) |
| result_dir | the root directory where all data are saved |
| index_file | the name of an index_file, in result_dir (useful for loading remote data). |

Details

This function will generate a query from tree different types of inputs:

1. A vector of names of .db files
2. A [data.frame](#) (recommended). In this case, the function will try to match requested data with data available on result_dir. The provided [data.table](#) has typically one row per requested individual and the columns (not necessarily in this order):
 - machine_name – the name of the machine in which the individual was (e.g. "ETHOSCOPE_001")
 - date – the start date of the experiment formatted as "YYYY-MM-DD"
 - region_id – the ROI in which the animal was. When *not provided*, all regions are queried.
 - time – the start time of the experiment formatted as "HH:MM:SS". When *not provided*, and multiple experiment for the same machine exist, *only the last one is loaded*.
 - ??? – any number of arbitrary columns* to associate conditions/treatments/genotypes/... to the previous columns.

Value

a [data.table::data.table](#). It contains the columns:

- path – the file to retrieve the data from
- experiment_id – an autogenerated unique id for the experiment
- region_id – a unique identifier of each individual (region of interest) within an experiment
- Variables already present in x (if x was a `data.frame`).

See Also

- [query_ethoscopes](#) – to load the actual data
- [list_result_files](#) – to list available file
- TODO – to understand the magical power of the query system!

Examples

```
# a query with no region_id, all regions will be loaded with the same metadata
dir <- paste0(scopr_example_dir(), "/ethoscope_results/")
data(no_region_id_query)
query <- parse_query(no_region_id_query, dir)
print(query)
# a query with region_id, only stated regions will be loaded with specific metadata
data(region_id_query)
query <- parse_query(region_id_query, dir)
print(query)
```

query_ethoscopes

Read data from ethoscope result files

Description

This function is used to import behavioural data generated by the **ethoscope platform**. That is it loads multiple `.db` files into a single R 'behavr::behavr table.`

Usage

```
query_ethoscopes(query, min_time = 0, max_time = Inf,
  reference_hour = NULL, verbose = TRUE, columns = NULL, ncores = 1,
  FUN = NULL, ...)
```

Arguments

query	data.table::data.table obtained by parse_query
min_time	Exclude data before min_time (in seconds). This time is <i>relative to the start of the experiment</i> .
max_time	Exclude data after max_time (in seconds). It is also relative to the start of the experiment.
reference_hour	Hour, in the day, to use as ZT0 reference. When unspecified, time will be relative to the start of the experiment.
verbose	whether to print progress (a logical)
columns	optionnal vector of columns to be selected from the db file. Time (t) is always implicitly selected.
ncores	number of cores to use for optionnal parallel processing
FUN	function (optional) to transform the data from each individual immediately after is has been loaded.
...	extra arguments to be passed to FUN

Details

todo

Value

a [behavr](#) table. The metadata contains all the query columns and an autogenerated id per animal. The data has the columns:

- id – autogenerated unique identifier, one per animal
- t – time
- Several variables recorded by ethoscopes (position, angle, width/height and others). Distance units (e.g. xy position, height/width) are expressed as a fraction of the width of the ROI they originate from.

See Also

- [behavr::behavr](#) – to understand the output format
- [parse_query](#) – to generate a query
- [read_metadata](#) – to show the metadata of a specific experiment
- [list_result_files](#) – to list available files

Examples

```
dir <- paste0(scopr_example_dir(), "/ethoscope_results/")
data(region_id_query)
query <- parse_query(region_id_query, dir)
print(query)

# default data loading
dt <- query_ethoscopes(query)
dt

# we use reference hour to set zt0 to 09:00 GMT
dt <- query_ethoscopes(query, reference_hour=9)
dt

#' # only load x and y positions
dt <- query_ethoscopes(query, columns=c("x", "y"), reference_hour=9)
dt
# apply function whilst loading the data
# todo use sleepR
dt <- query_ethoscopes(query, reference_hour=9, FUN=head)
dt
```

read_metadata	<i>Retrieve metadata from an ethoscope result file</i>
---------------	--

Description

This function is used to obtain metadata – such as *time and date* of the experiment, *acquisition device*, and *version of the software* – embedded in a result file (.db) generated by the ethoscope platform.

Usage

```
read_metadata(FILE)
```

Arguments

FILE	the name of the input file
------	----------------------------

Value

a list containing fields for metadata entries

See Also

- [query_ethoscopes](#) – to load the actual data
- [list_result_files](#) – to list available files

region_id_query	<i>A simple toy query experimental conditions for 15 animals in three experiments. the condition (test) is linked to the experiments, and another condition (treatment) is per animal. It serves as a simple example. #'</i>
-----------------	--

Description

A simple toy query experimental conditions for 15 animals in three experiments. the condition (test) is linked to the experiments, and another condition (treatment) is per animal. It serves as a simple example. #'

Usage

```
region_id_query
```

Format

An object of class `data.frame` with 15 rows and 6 columns.

Author(s)

Quentin Geissmann

scopr_example	<i>Get path to scopr example</i>
---------------	----------------------------------

Description

scopr comes with a sample DAM2 files in its inst/extdata directory. scopr_example allow make them easy to access.

Usage

```
scopr_example(path = NULL)
```

```
scopr_example_dir()
```

Arguments

path	Name of file. If NULL, the example files will be listed.
------	--

Author(s)

Hadley Wickham (modified from readr)

Examples

```
# list all files
scopr_example()
```
